

## Energy Star Quality Installation

**You may be familiar with the Energy Star label on energy efficient heating and cooling equipment, but did you know there are also Quality Installation (QI) guidelines to help ensure that heating and cooling equipment is installed properly?**

Nearly half of all heating and cooling equipment in U.S. homes never performs to its advertised capacity and efficiency due to incorrect installation. This means homeowners pay higher operating costs over the life of the equipment.

The Energy Star QI program helps homeowners identify contractors who install heating, ventilation, and air conditioning (HVAC) equipment to the QI guidelines. By purchasing high efficiency equipment and having it properly installed, homeowners can lower their energy bills, increase comfort in their home, and extend the useful life of their equipment.

The Energy Star QI program requires a local sponsor, such as an electric or gas utility. If your utility does not yet offer an Energy Star QI program, you may be able to find local contractors, like Presidential, that follow some of the Quality Installation procedures.

### **Proper Sizing of Equipment**

Installing the right size equipment for your home is essential to getting the best performance for your heating and cooling equipment and maintaining the comfort you deserve.

Some believe that bigger is better when buying new equipment, but a system actually operates best when each component is properly sized. Oversized equipment may cycle on and off more frequently, which can make the home less comfortable and shorten the equipment life.

In the Energy Star QI program, contractors will take measurements of your home then do calculations to determine the appropriate size for your air conditioner, furnace or heat pump.
