Just because your heat pump isn't working as efficiently as it used to, that doesn't mean you need to replace it.

Separately the signs below are not reason enough to replace a heat pump. However, the more symptoms your heat pump is experiencing the more likely it is time to replace it.

Check the box that most represents your situation.

Rate Your Symptoms

How many of these signs apply to your heat pump?

Check the appropriate box for each question to evaluate your heat pump.

Take the score from each question and add up the totals - there are 8 questions so the minimum is 8 and the maximum is 40.

If you score 20 points or more, and the repair is more than 10% of the cost of a new system, it is likely time for a replacement unit.

Consult with a heat pump specialist for a thorough evaluation and recommendation.

Proper installation is key to the performance of your heat pump. An improperly installed heat pump decreases both efficiency and your comfort while increasing your energy bill.
