

# Is Your Heating System Ready for Winter?

**TAKE THE QUIZ**

Brought to you by your friends at

**PRESIDENTIAL**  
HEATING & AIR CONDITIONING, INC

The chill of winter is upon us and you want to make certain that your heating system is ready to provide safe, dependable, warmth all season long. Here are some questions to determine if you're all set, or discover that you have a big list to work on!

 Check the appropriate box for each question to see how ready you are.

## How Many of These Questions did You Answer "Yes" to?

The more times you answered anything other than "yes", it not only means a long list of to-dos, but the more likely it is that your system will break down just when you need it most. It also means that the lifespan of your system is likely getting shorter and your safety may be compromised.

If answering "yes" to all of these questions seems a bit overwhelming, you may want to consider getting a professional heating and air conditioning company to send a qualified technician to perform seasonal checkups. They will check all of your "yes" boxes as well as complete a long list of additional checks to keep your system safely running at its peak, and your home warm and cozy.

**Did you know** that most HVAC companies offer a service and maintenance plan that will give you 2 check-ups per year, as well as some other great benefits?

	NO	NOT SURE	YES
Do you change your filter once a month?			
Furnace: Is your furnace flame a nice crisp blue?			
Have you cleaned your condensate lines in the last 12 months?			
Heat Pump: Have you removed all debris from around your outdoor unit?			
Do you have a professional check and tune your system each Spring and Fall?			
Have you visually inspected capacitors for leakage and rust?			
Have you checked carbon monoxide emission level?			
Have you checked and calibrated your thermostat lately?			
Have you cleaned your registers and returns this Fall?			
Have you inspected readily accessible ducts for obvious air leaks?			
Have you inspected your blower wheel and motor?			
Heat Pumps: Have you checked emergency heat systems for proper operation?
